

TEXT INPUT	IMAGE INPUT	REASONING	FINAL OUTPUT
Enthymeme: He said smoking causes cancer. Context: No context for this image.		<reasoning> The enthymeme provided is "He said smoking causes cancer." This statement appears to be a claim about a cause-and-effect relationship between smoking and cancer. Given the context of the image, which shows a doctor (Dr. John) examining a patient, it suggests a medical professional discussing health-related information. The argumentation schemes provided include several types, but the one that seems most relevant to the enthymeme is the "Effect to Cause Argumentation scheme." This	<final_output> [position_to_know(Dr_John, medicine),asserts(Dr_John, smoking_causes_cancer),contain(medicine,smoking_causes_cancer)], smoking_causes_cancer </final_output>
Enthymeme: The weatherman knows about weather forecasts. Context: The user lives in Santa Rosa.		<reasoning> // The enthymeme provided is "The weatherman knows about weather forecasts." This seems to relate to the Position to Know Argumentation scheme, which involves an expert (in this case, a weatherman) making a claim about their field of expertise (weather forecasts). The image shows a weatherman presenting a weather forecast, specifically pointing	<final_output> //[position_to_know(weatherman, weather_forecasting),asserts(weatherman, rain_and_breezy_weather_for_Santa_Rosa),contain(weather_forecasting, rain_and_breezy_weather_for_Santa_Rosa)], rain_and_breezy_weather_for_Santa_Rosa </final_output>
Enthymeme: Susan knows about mathematics. Context: Susan is the user's teacher. The user didn't understand the solution to the first equation.		<reasoning> To solve this problem, we need to identify the argumentation scheme that matches the given enthymeme and then instantiate its variables using the provided image and context. The enthymeme given is: "Susan knows about mathematics."	<final_output> [position_to_know(Susan, mathematics),asserts(Susan, solving_quadratics_by_factorization),contain(mathematics, solving_quadratics_by_factorization)], solving_quadratics_by_factorization </final_output>

Enthymeme: All roses are flowers. Context: The user received this.		<reasoning> // The enthymeme provided is "All roses are flowers." This seems to be a part of a classification argument. // The image shows a bouquet of white roses. // The context does not add much but implies a visual confirmation of roses. // To complete the argumentation scheme for Classification, we need to identify the classification and the specific instance. // From the enthymeme, we understand that roses are being	<final_output> // classification(roses, flowers), be (these_white_roses, roses)], be (these_white_roses, flowers) </final_output>
Enthymeme: All BMWs are cars. Context: The user just saw this.		<reasoning> The enthymeme provided is "All BMWs are cars." This sentence appears to be part of a classification argumentation scheme. The image shows a BMW X5, which is a specific model of a car. To instantiate the variables of the	<final_output> [classification(BMW,car),be (BMW_X5,BMW)],be(BMW_X5,car) </final_output>
Enthymeme: All laptops are electronic devices. Context: The user wonders which specific laptop this is.		<reasoning> // Step 1: Identify the enthymeme and the context. The enthymeme given is "All laptops are electronic devices." The context provided is that the user wonders which specific laptop this is, and there's an image of a laptop. // Step 2: Analyze the enthymeme to determine which argumentation scheme it fits. The enthymeme	<final_output> // Classification Argumentation scheme: [classification(F,G),be(A,F)], be(A,G) // Instantiated with: [classification(laptop, electronic_device),be(MacBook, laptop)],be(MacBook, electronic_device) </final_output>

TEXT INPUT	IMAGE INPUT	REASONING	FINAL OUTPUT
Enthymeme: He said smoking causes cancer. Context: No context for this image.		<pre><reasoning> 1. **Identify the core argument in the enthymeme**: The statement "He said smoking causes cancer" suggests that because a specific person (referred to as "He") made a claim, that claim is true. 2. **Link the enthymeme to the image**: The image shows a man in a white medical coat with a name tag that reads "Dr. John". The "He" in the sentence refers to this doctor. 3. **Select the appropriate argumentation scheme**: Since the argument relies on the assertion of an individual who is in a specialized position (a doctor) to make a claim</pre>	<pre><final_output> [position_to_know(dr_john, medicine), asserts(dr_john, causes(smoking, cancer)), contain(medicine, causes(smoking, cancer))], causes(smoking, cancer) <final_output_f></pre>
Enthymeme: The weatherman knows about weather forecasts. Context: The user lives in Santa Rosa.		<pre><reasoning> 1. **Identify the Argumentation Scheme**: The enthymeme "The weatherman knows about weather forecasts" suggests that an individual (the weatherman) has specialized knowledge in a specific field (weather forecasting/meteorology). This corresponds to the **Position to Know** argumentation scheme, where an expert's assertion is</pre>	<pre><final_output> [position_to_know(weatherman, meteorology), asserts(weatherman, rainy_and_breezy_on_tuesday_in_santa_rosa), contain(meteorology, rainy_and_breezy_on_tuesday_in_santa_rosa)], rainy_and_breezy_on_tuesday_in_santa_rosa <final_output_f></pre>
Enthymeme: Susan knows about mathematics. Context: Susan is the user's teacher. The user didn't understand the solution to the first equation.		<pre><reasoning> 1. **Identify the Argumentation Scheme**: The enthymeme provided is "Susan knows about mathematics." This statement identifies a person (Susan) and her domain of expertise (mathematics). Among the available schemes, the **Position to Know Argumentation scheme** ('[position_to_know(A,S), asserts(A,Ar), contain(S,Ar)], Ar') is the best fit</pre>	<pre><final_output> [position_to_know(susan, mathematics), asserts(susan, solution(x^2=42-x, [-7, 6])), contain(mathematics, solution(x^2=42-x, [-7, 6])), solution(x^2=42-x, [-7, 6])] <final_output_f></pre>

Enthymeme: All roses are flowers. Context: The user received this.		<reasoning> 1. The provided enthymeme is "All roses are flowers." This statement establishes a general rule where one category (roses) is classified under another broader category (flowers). 2. Reviewing the available argumentation schemes, this fits the "Classification Argumentation scheme," which has the structure: [classification(F,G),be(A,F)],be(A,G). 3. In this scheme: - F represents the sub-category (rose)	<final_output> [classification(rose,flower),be(white_roses,rose)],be(white_roses,flower) <final_output_f>
Enthymeme: All BMWs are cars. Context: The user just saw this.		<reasoning> 1. Identify the Argumentation Scheme: The enthymeme "All BMWs are cars" expresses a categorical relationship where one group (BMWs) is defined as belonging to a larger category (cars). This aligns with the Classification Argumentation scheme: [classification(F,G),be(A,F)],be(A,G).	<final_output> [classification(bmw, car), be(bmw_x5, bmw)], be(bmw_x5, car) <final_output_f>
Enthymeme: All laptops are electronic devices. Context: The user wonders which specific laptop this is.		<reasoning> 1. Analyze the Enthymeme: The provided enthymeme is "All laptops are electronic devices." This is a general categorical statement that defines a relationship between two classes: "laptops" and "electronic devices". This type of statement corresponds to the 'classification(F, G)' component of the Classification Argumentation scheme.	<final_output> [classification(laptop, electronic_device),be(macbook, laptop)],be(macbook, electronic_device) <final_output_f>
